

My main strategy is to locate the program elements on to the site as **initial elements** and allow a **gradual dismembering** and merging of elements to occur. The main enclosed volumes **fracture** more as the element is relating more to the water surface. While the main **cracks** allow for transition to occur in terms of Transfer zones, the **fragmented and dispersed** elements both define themselves and the larger **hypersystem**. The hypersystem is composed of varying levels and scales of definition to relate itself with the hypercoastline concept.

In terms of **time**, new cracks can occur within the surface gradually in the **present**.

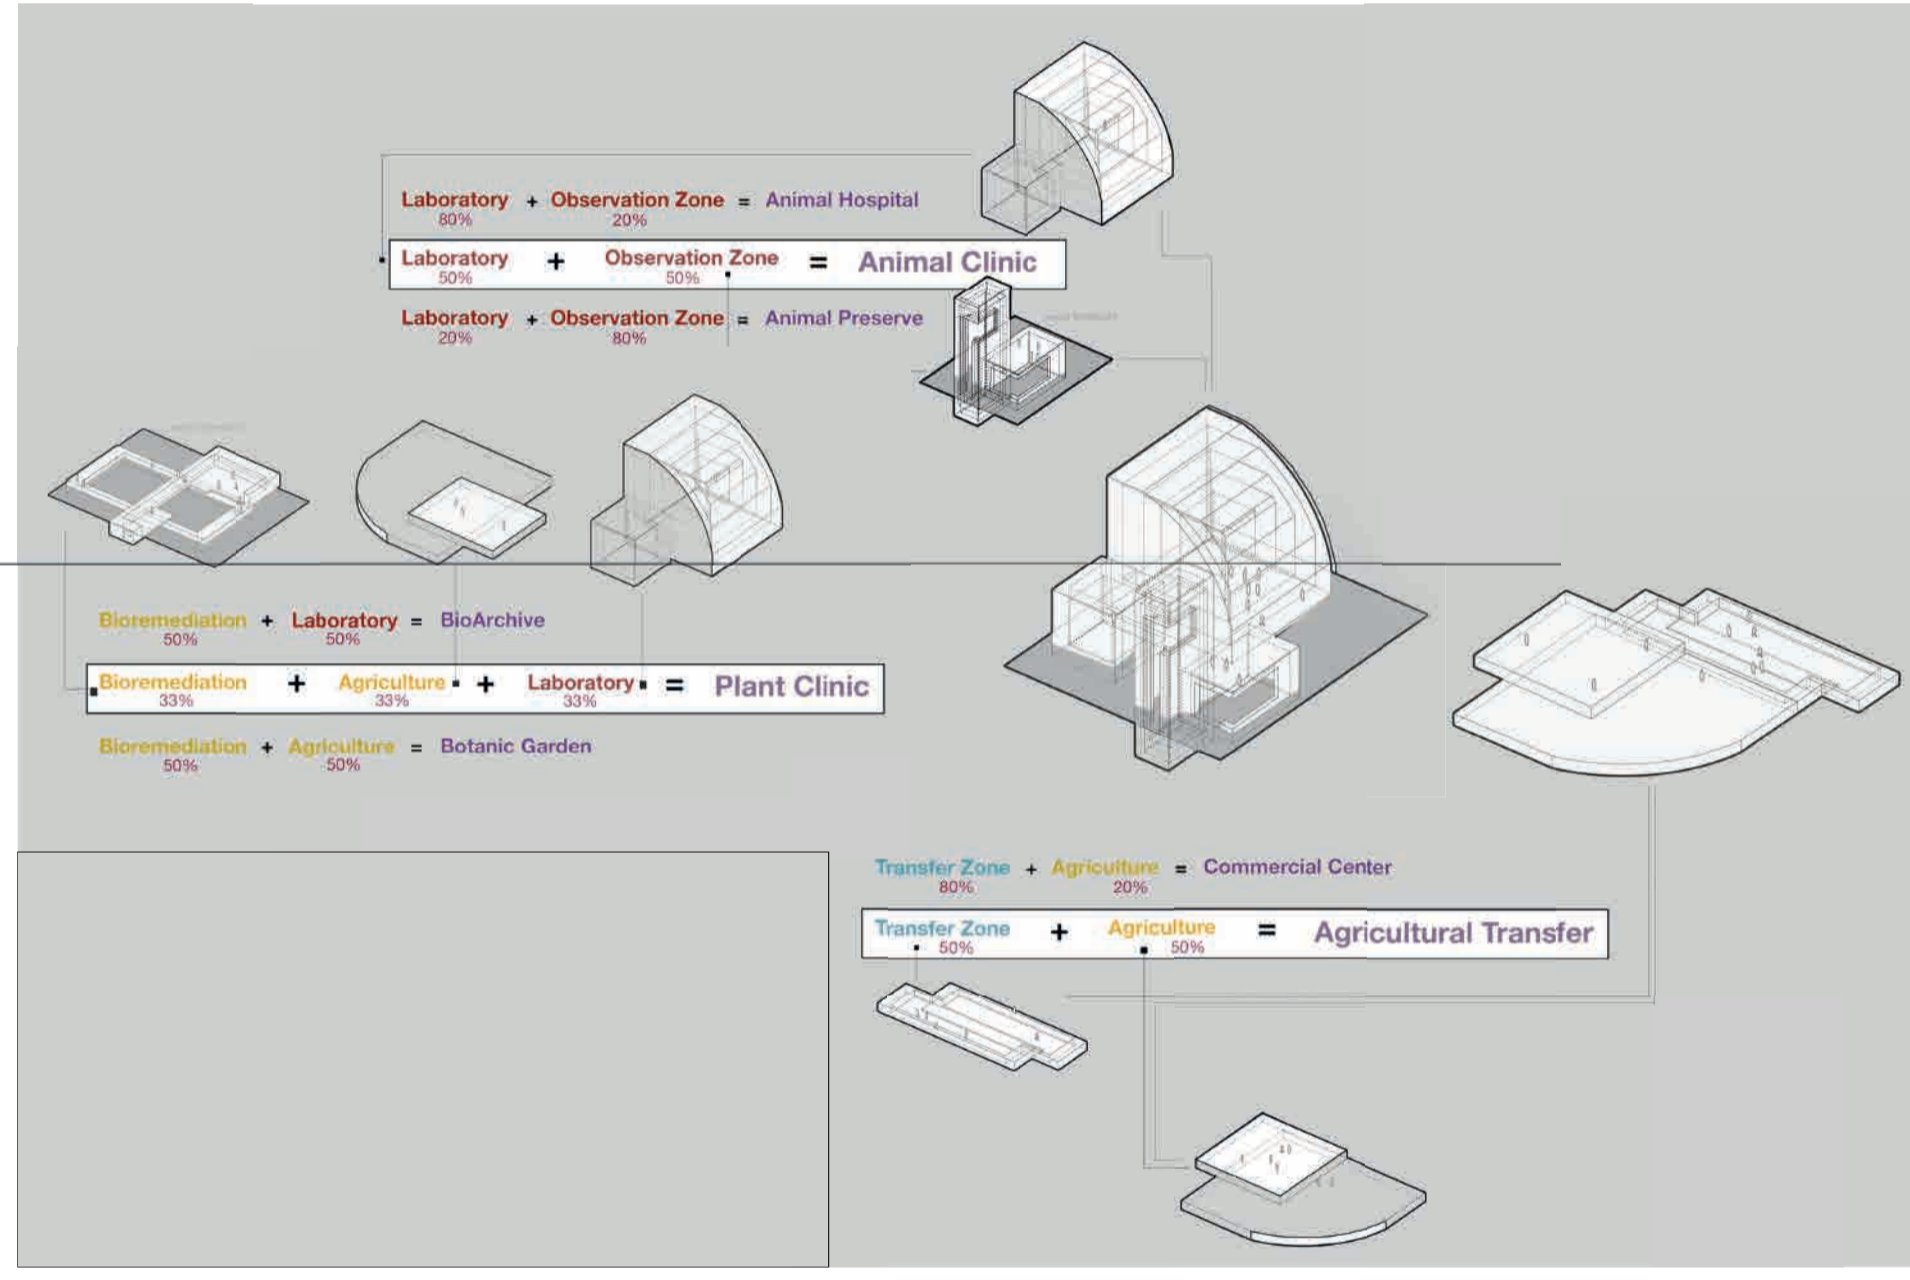

In terms of **place**, The fractured elements of the larger-scale surface can be **relocated** and allow to be part of the newly forming coastline.

In terms of **scale**; the main surface is being fractured in the same manner as how the smaller-scaled surfaces are fractured forming a **hyperscale** object.

**PROGRAM1**  
**Hypercoastline** <sup>\*</sup> Rising Sea Levels

The Hypercoastline is rising and the newly formed coastline is required to adapt to change. The rising sea water is bioremediated to feed the agricultural program while the Research Laboratory finds new ways to embrace the changing environmental conditions. Observation Zone and Recreation program increases the experience of eco-consciousness of the local residents. The agricultural transfer and the community assembly bring people to interact with the sustainable ecosystem.

WHAT is my concern?  
**Hypercoastline**

WHY ?  
Creating a design where rising **sea levels** of the site of "izmit" context, where a lot of **flat landscape** and wetland makes it prone to drastically different spatial experience of land and water throughout **scale, time and place**.

HOW ? Operations, Strategy  
a closed system that is capable of change  
Defining programmatic layers as mass that fracture and shift through scale, time and place  
The transitory urban network connecting ecology by fracturing program elements  
The contraction and relationship with the coastline is explored by concentrating programmatic intersections on the intersection zone between the road infrastructure and the river.
